

Little Black Cormorant

Phalacrocorax sulcirostris

On the beach

All year round

The **Little Black Cormorant** is a small, all-black cormorant that sometimes forms large flocks of many hundreds of birds. They locate fish from the air and then chase the prey underwater.

Beak-to-tail: 55 – 65 cm

In the estuary

Out to sea

All year round

Pied Cormorant

Phalacrocorax varius

The **Pied Cormorant** is a larger cormorant. It is black above and white below, with a pale-coloured beak and a yellow facial spot in front of the eye. It does not have a white eyebrow and can be seen in small numbers in the estuary or out to sea.

Beak-to-tail: 65 – 80 cm
